

Figure 1 consists of five vertically stacked line graphs, each representing a different region: Line Islands, Hawaii, Mariana, Equatorial, and Samoa. The y-axis for all graphs is 'Mixed layer depth, m', ranging from 20 to 35. The x-axis represents years from 1996 to 2026, with major ticks every five years. Each graph contains multiple lines representing different locations, with a thick black line indicating the mean. The lines are color-coded by region: blue for Line Islands, red for Hawaii, green for Mariana, orange for Equatorial, and yellow for Samoa. In the Line Islands graph, most locations show a slight increase in depth over time. In the Hawaii graph, some islands like Lanai show a decrease, while others like Johnston show an increase. The Mariana graph shows a general upward trend for most locations. The Equatorial graph shows a slight decrease for some locations like Palmyra and Kingman. The Samoa graph shows a slight increase for most locations.
